

# Links

A link consists of either just the straight URL, or the URL and the name. If you add a name to a link, that is shown instead of the URL and is easier to read.

There are two kinds of links in a Wiki -

- internal, links that lead to pages that are also in the Wiki and
- external, links that lead to other websites

Links consist of double square brackets around the link - whether it is a URL or the name of a Wiki page.

- `[ [ http: website.com ] ] * [ [ Name of page ] ]` To add a name to a link, you include the pipeline character (*shift+slash*) \* `[ [ http: website.com | name of website ] ]`
- `[ [ Name of page | name of page ] ]`

If you create a link to a page that does not yet exist, you can [Create that page](#)

A Red link points to a page that does not yet exist. A Green link points to a page that does exist.
